

ABSTRACT

An object is to provide an electric plug that can be pulled out silently and easily with one hand even from a power socket not secured without requiring any special device in or around a plug body. A front surface part and a back surface part to which the first finger and the second finger, respectively, of a gripping hand gripping the plug body are applied are provided on a forward end side of the plug body. A grip part for the third and subsequent fingers provided with a grip-shift stopper arranged at a part between a rear end of the front and back surface parts of the plug body and a position at a distance of about a four-finger width of the hand from the forward end of the plug body is provided. The electric plug can be pulled out from the socket by applying the first and second fingers of the gripping hand to the forward end side of the plug body, holding the grip part with the third and subsequent fingers, and then pushing the upper surface of the socket with the tip of the first finger.
